Verified key content

- Data: "NielsenIQ's Homescan Consumer Panel data for 2007 to 2019" covering "60,000 US households' grocery purchases."
- Product-level demand: "The mean own-price elasticity for our preferred nested logit model of Column I is 4.77" (in absolute value; i.e., -4.77). Demand for individual wine products is quite elastic on average.
- Aggregate demand: "For our preferred model in the first column, this elasticity value is 0.53" (i.e., -0.53). "This indicates that, in the aggregate and on average, wine demand is inelastic."
- Team implication (interpretation, not the paper): category price cuts cannot restore total demand, but one winery's repricing can move share powerfully.
